## **PLANT'S CHOICE<sup>®</sup> BIORETENTION SOIL/ BIOSWALE SOIL 70**

(Please state the product name and reference number when specifying and/or ordering)

**PRODUCT REFERENCE: BSM7030DG**

For quality assurance purposes, Plant's Choice<sup>®</sup> Bioretention Soil/ Bioswale Soil for larger orders (and special specifications) is custom blended from the latest batches of specially selected screened loamy soil and soil conditioner towards meeting project specifications (but some variation should be expected) and will be accompanied by a laboratory soils report and Agronomist recommendations based on the latest batch of material used. The soils report will indicate typical values for characteristics such as salt levels and percolation, etc., for the batch. It is recommended that a sample be tested for submittal approval as well as prior to delivery. The lab tests will help verify quality targets. A custom specification sheet based on the relevant laboratory test values can be created specific to your job upon request and other useful soil additives such as gypsum, fertilizers, etc., can be added per customer's instructions. After review with your approving authority please advise us of any desired adjustments in characteristics so that a new sample blend can be tested and reviewed. This process can be repeated as necessary until a desired custom blend is reached. Materials and recipe per the tested/approved sample will be used for production however some variations should still be expected.

To facilitate our customers with smaller jobs Plant's Choice maintains a small stockpile of preblended bioretention soil (subject to availability). This stockpile and corresponding laboratory soils report will be available on an as-is basis.

The following are the typical target ranges of our blends for various soil characteristics (unless stated otherwise in the soils report). The soil blend typically has reasonable levels of organic matter, moisture, nutrients, pH, infiltration and salt levels typical of the region. It is typically earthy brown in color. This information is for reference purpose only as there can be variations with each batch due to characteristic variation in blend components. Product will be blended when purchased and is not stockpiled. During blending, ratios will be adjusted to approximately 70% decomposed granite and 30% compost. A sample can be blended and provided for testing such as infiltration and agricultural suitability upon request if needed. Orders are subject to review and approval of sample.

Bioretention/ bioswale soil regardless of its producer is subject to variations due to variations in blend components and we recommend the testing protocol described above.

Laboratory soils report and corresponding agronomist recommendation of previous sample blend test is for reference only.

This will be a custom blended soil and the Customer is fully responsible for compliance and approval by supervising General Contractor, Architect or Engineer. Laboratory testing is at customer's cost.

Please note that use of soil will alter soil characteristics. If upon unloading the material is compacted, rolled, seeded, left to sit for extended amount of times etc., the soil characteristics may change. Plant's Choice is not responsible for soil characteristics after delivery.
